

## 经常写的jdbc写到一个类中:

```
1 public class JDBCUtils4 {
2     //把经常修改的提取出来
3     public static final String DRTVER="com.mysql.jdbc.Driver";
4     public static final String URL="jdbc:mysql://localhost:3306/db1227?characterEncoding=utf-8&useSSL=false";
5     public static final String USERNAME="root";
6     public static final String PASSWORD="root";
7     //创建数据库连接池,所有连接都从池中获取
8     private static DruidDataSource druidDataSource=new DruidDataSource();
9
10    //在静态代码块,加载驱动,保证只执行一次
11    static {
12        druidDataSource.setDriverClassName(DRTVER);
13        druidDataSource.setUrl(URL);
14        druidDataSource.setUsername(USERNAME);
15        druidDataSource.setPassword(PASSWORD);
16    }
17
18
19    public static QueryRunner getQueryRunner(){
20        QueryRunner queryRunner=new QueryRunner(druidDataSource);
21        return queryRunner;
22    }
23 }
```
